

ndq ticketing

Context:

in a Data Quality platform, we need build ticketing menu like forum dashboard for publish any issue about data quality and user can discuss to each issue-post. we've already have the UI, but we need to adjust UI using our style.

Detail page and feature:

Default page

default page

in default page, we display card content about the issue of data quality, in each card-post, there are data such as who's post the issue, ID ticket, created time, title issue, like button/upvote, tag, status of issue:

- backlog
- active issue/in progress
- done/arsip solusi

There are content like how many people are like, view and replies the post, there is SLA information (for now, just create <12h as default). There is issue category also, it's created when user input the issue category item in form for post the issue, it mean, provide in the create new issue form, for example issue category is NDM-DataQuality-Completeness.

Navbar

In the left side, there is nav bar act as a filter categories, so as a default, please provide default folder structure like this (you can refer with the image as well):

- NDM
 - Data Quality
 - Completeness
 - Validity
 - Data Ingestion
 - Format Data
 - Keamanan dan akses table

Please provide expand all and collapse all, also provide request category button. Request category button has function to create new type of category filter, so there is a form as it should be, for the form just provide a input file, where the user just fill the form with this format: title/title/title.

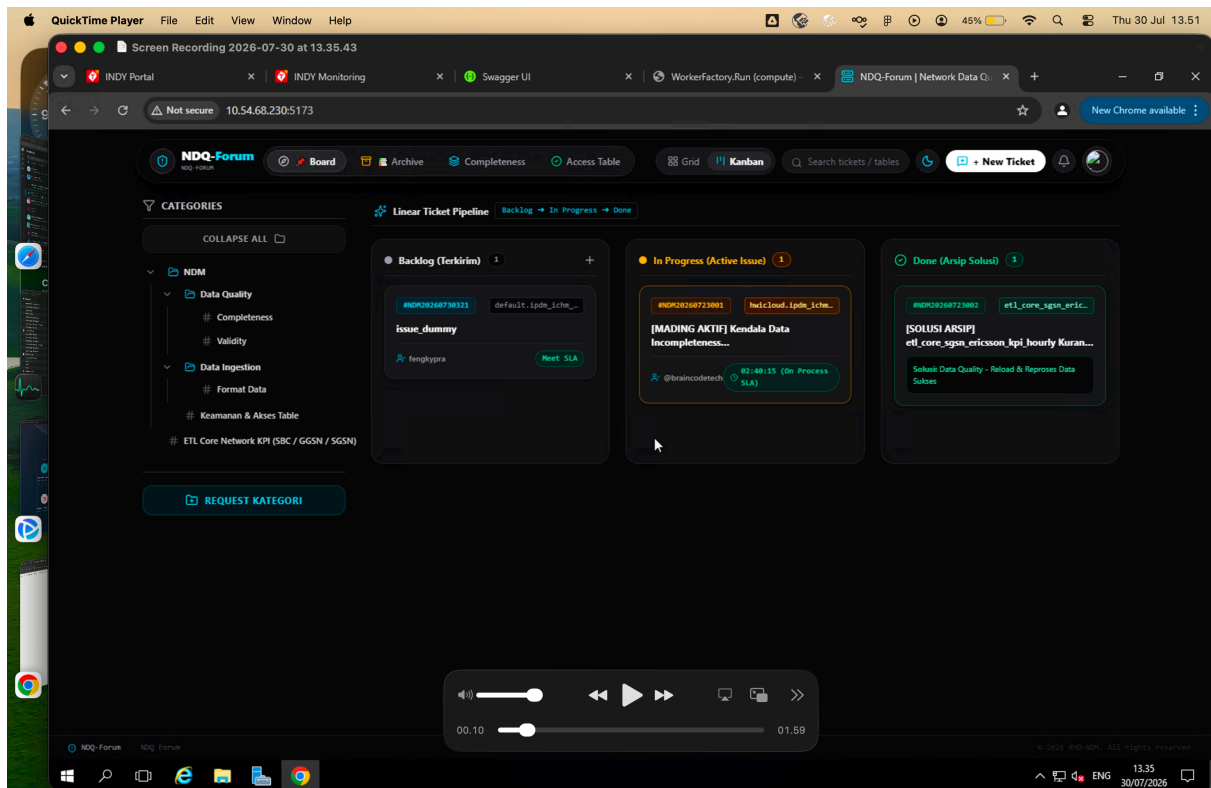

Specific filter

as a default, please provide top filter, that has function to:

- Board: act as a default
- Archive: where user can visit all closed ticket to see way to solve

Display category

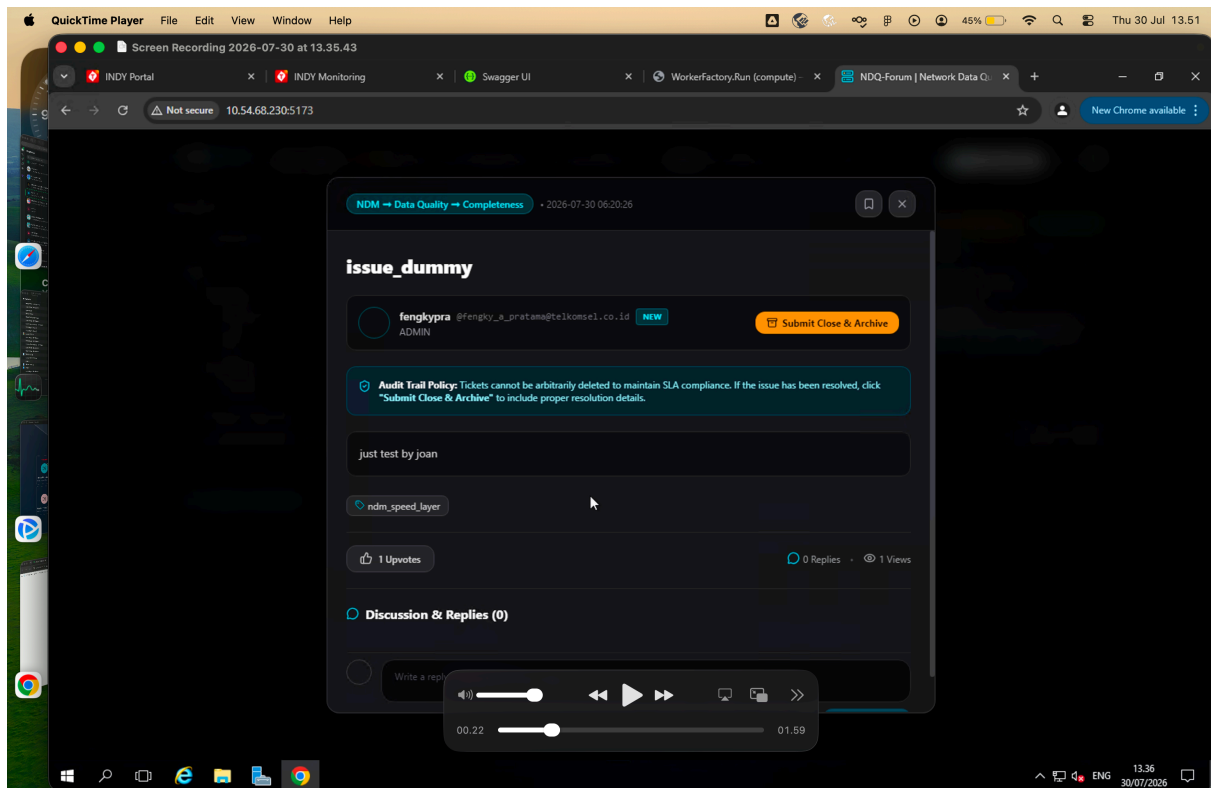

please provide display content filter, where the display content has view as a grid (like default page image), list table and also kanban board. This is example of the kanban board from the reference:

kanban board view

In the kanban board, just divide 3 step or category (backlog, in progress/active issue, done/arsip solusi), so this is relate to the status issue I've mentioned before. in the kanban board, please provide functionality such as drag and drop to each pool, for example we can drag one card from backlog pool to in progress pool.

Detail post

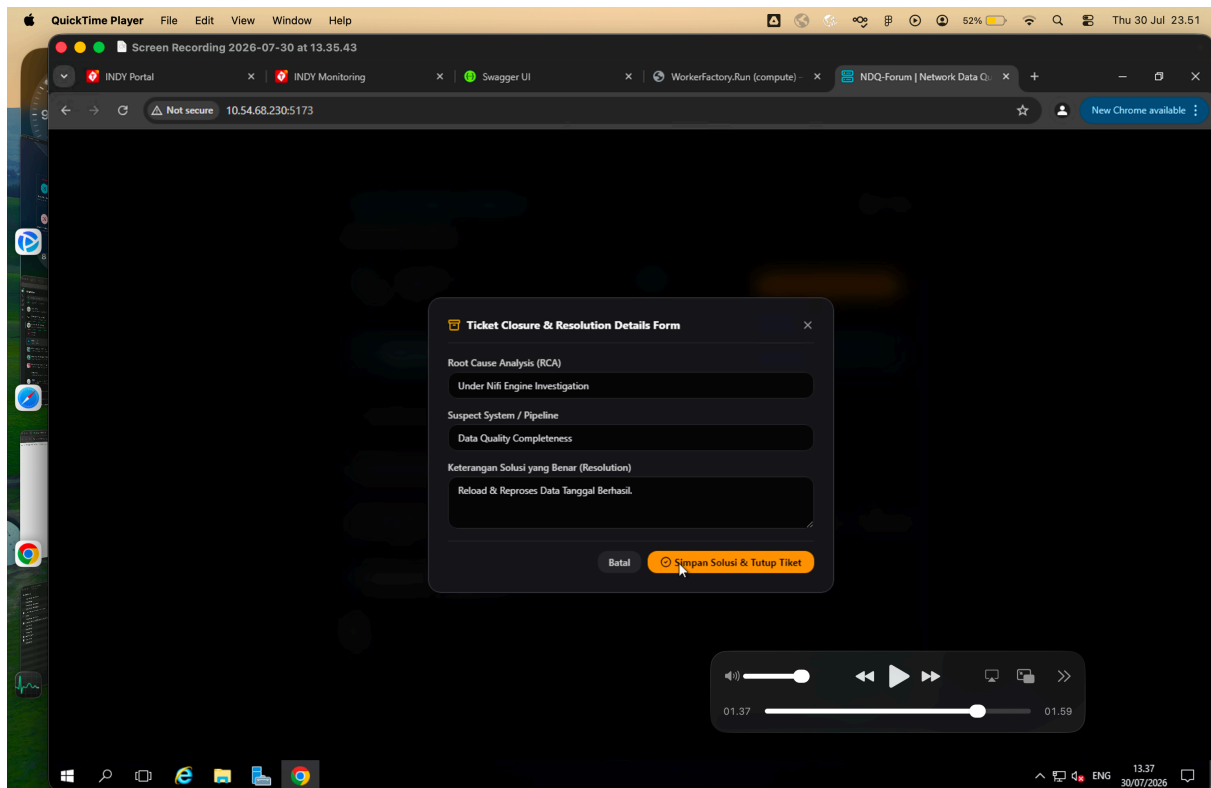

detail post

in the detail post, user can see information such as: who's post the issue, ID ticket, created time, title issue, tag, status of issue, issue category, button of submit close & archive, SLA information, upvote and discussion feature.

For the discussion feature, please make sure user can upload image and reply from the other user. please consider to create simple User Interface and journey of reply, make them simple to see and use, because expected there are a lot of replies later.

for the button of submit close & archive, it has function to make the issue done and will be save to the archive menu, it has a purpose to include proper resolution details, in order user can see the archive when there is same issue in same context in the future. This is example form when user should fill after click the button:

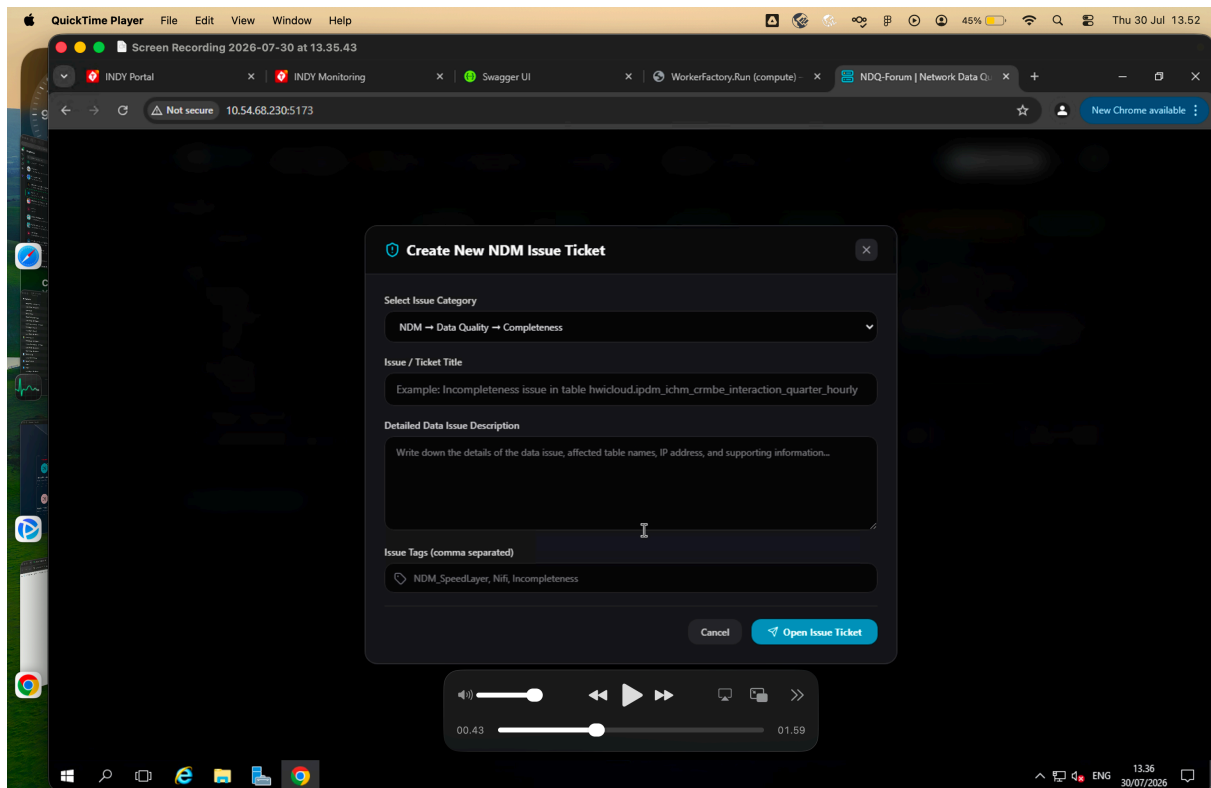

form to close ticket and archive

Create new ticket

In create new ticket, user should fill the form like example below, but in the example, select issue category has 3 values at same time, please separate them into 3 input but still under issue category, so the input would be:

- application: e.g NDM
- Type: e.g Data Quality
- Dimension: e.g Completeness

create new ticket from

Note

- you are a senior ui ux design, please consider any bad journey or flow into good UX, if my reference UI is oke, go on, but if not, please give good improvement.
- please make this menu just focus with white mode, so the toggle button of mode isn't necessary for now.
